# ADSICS

#### **Anomaly Detection System for Industrial Control Systems**

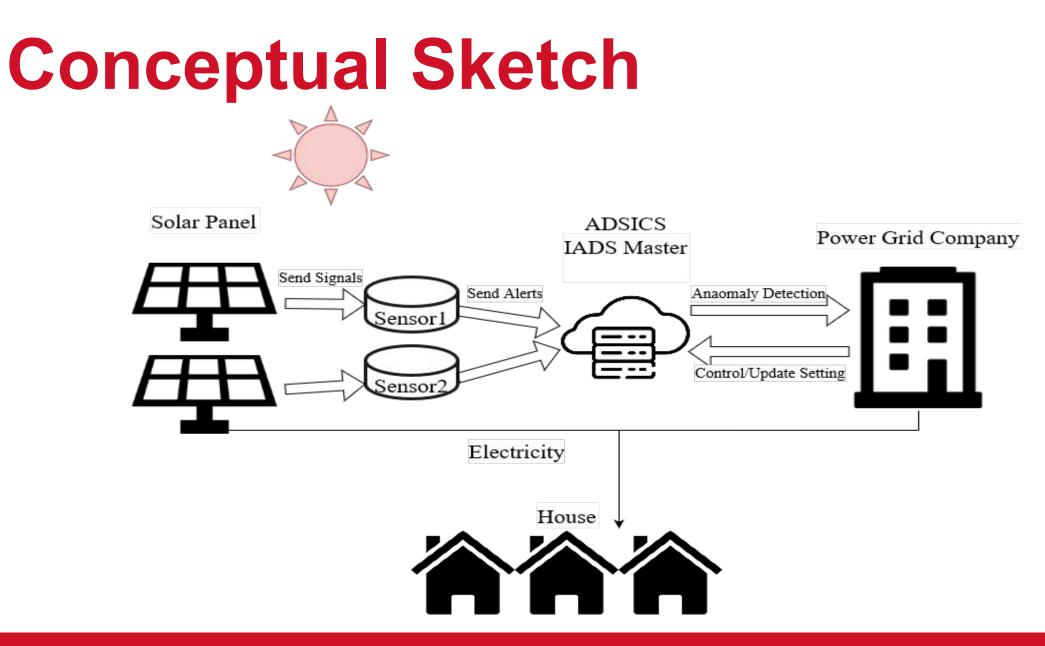

SDMay22-38 : Alex Nicolellis, Muhamed Stilic, Pallavi Santhosh, Jung Ho Suh Client : Dr. Manimaran Govindarasu

Advisors : Dr. Manimaran Govindarasu, Moataz Abdelkhalek

## **Problem Statement**

- Attacks on power distribution companies are now more common due to the increased use of IoT devices and the lack of security on power grid systems.
- ADSICS is a surveillance program that detects and prevents cyber attacks using anomaly detection.

#### IOWA STATE UNIVERSITY

#### IOWA STATE UNIVERSITY

# **Requirements & Constraints**

#### **Functional Requirements:**

- Use machine learning to detect network anomalies
- Verify incoming alerts and discard false positives
- Display alerts for easy human understanding
- Present temporal and spatial details for each alert

#### **Non-Functional Requirements:**

- Alerts should be presented intuitively
- Alerts should be received within 10ms
- The system should be able to handle a large volume of alerts
- The system should be reliable and maintain uptime continuously

#### **Constraints:**

• The anomaly detection must use SecurityOnion tools (specifically Elasticsearch)

### IOWA STATE UNIVERSITY

## **Standards**

Standard	Application	Justification
IEEE 692-2013	IADS SENSOR IADS MASTER	Addresses cybersecurity and control related equipment requirements for threat assessment.
ISO IEC 27039-2015	IADS MASTER	Provides guidelines for selection, deployment, and operations of intrusion detection system detection and prevention systems.
ISO/IEC 27017:2015	CLOUD SERVER	Provides guidance on the information security aspects of cloud computing, recommending the implementation of cloud-specific information security controls that supplement the guidance of the ISO/IEC 27002 and ISO/IEC 27001 standards.
IEEE 1711.2-2019	IADS SENSOR	Protects communication of intelligent devices in the power industry.
IEEE 802	IADS SENSOR	Describes recommended practices for communication over various types of networks, such as wireless networks.

### IOWA STATE UNIVERSITY

# **Market Survey**

- Previous work by client D-IDS for Cyber-Physical DER Modbus System
- Datasets: KDD, IDS, NSL+KDD, IoT23
- Anomaly detection algorithms:
  - Decision Tree
  - Random Forest
  - K-Nearest Neighbor
  - Support Vector Machine
  - Deep Neural Network

#### IOWA STATE UNIVERSITY

# **System Architecture**

#### **Functional Decomposition:**

IADS Sensor, IADS Master

**Operating System:** 

Kali Linux, Linux(SO), and Windows XP

#### Software Architecture:

- vSphere virtual machine
- SecurityOnion
  - ElasticSearch machine learning
  - Kibana visualization
  - SNORT filtering

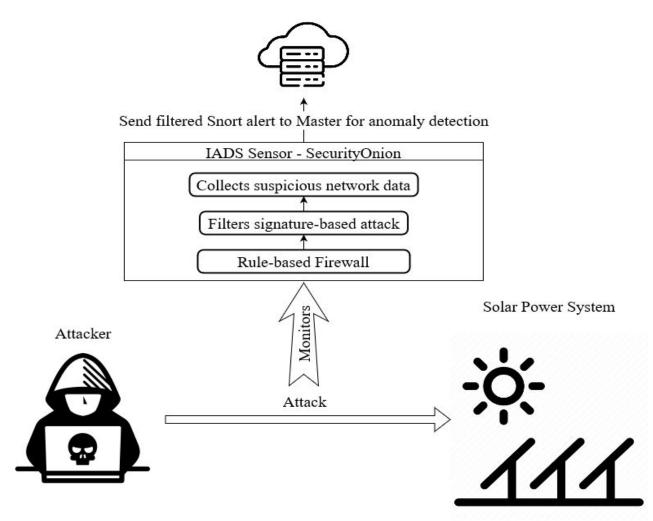

#### IOWA STATE UNIVERSITY

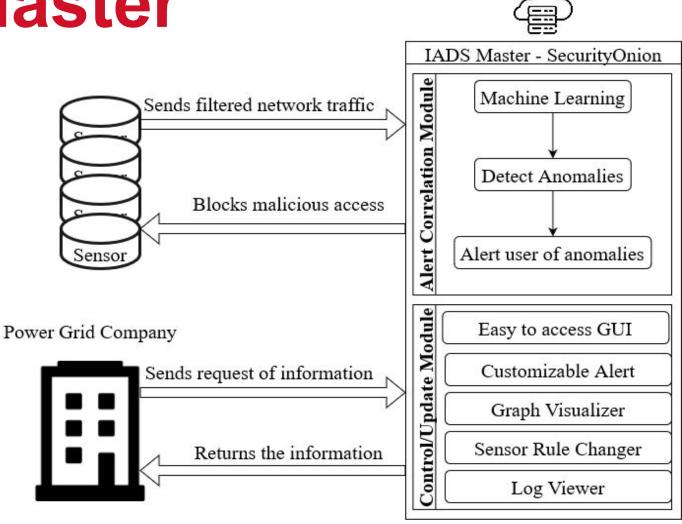

### **IADS Sensor**

ADSICS IADS Master

#### IOWA STATE UNIVERSITY

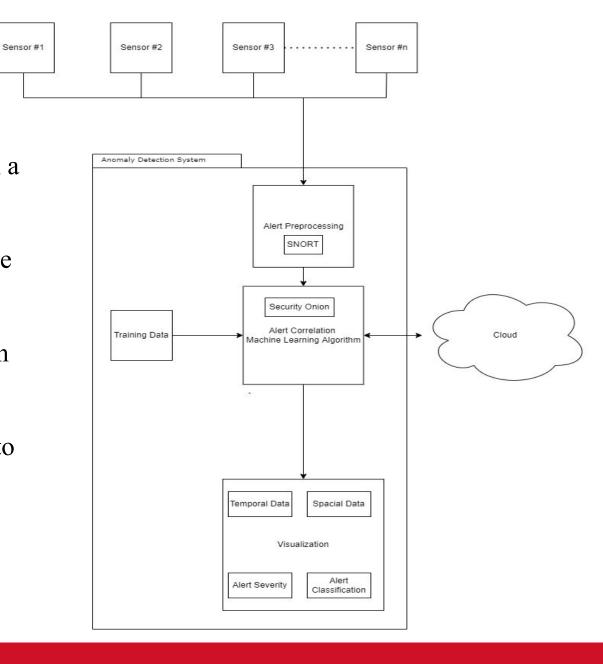

## **IADS Master**

#### IOWA STATE UNIVERSITY

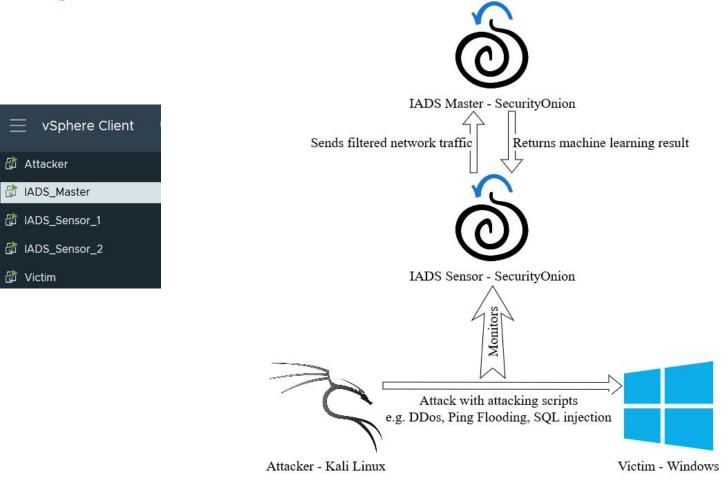

# **Detailed Diagram**

- Our design accepts many alerts as input, originating from a variety of sensors
- These alerts will be processed, ensuring that they enter the anomaly detection system
- Then, our algorithm will perform alert correlation through the Cloud
- Our machine learning model will be trained by a dataset to draw relationships between alerts
- The conclusions will then be visualized for user analysis

#### IOWA STATE UNIVERSITY

# **Testing and Evaluation**

- Testing is performed on the actual platform (Client VM)
- Functional testing
  - JUnit, Mockito UI testing
  - Visualization testing
- Security evaluation
  - Black box testing Low false positive, false negative rate

**College of Engineering** 

- Timing evaluation
  - Real-time operation

#### IOWA STATE UNIVERSITY

# **Design Complexity**

- Our design required understanding of advanced technical concepts such as anomaly detection, network intrusion, and machine learning algorithms. Since none of us had any background in cybersecurity, this caused us to spend an unexpected amount of time conducting background research.
  - The required testbed environment was unreliable.
- Design iterations needed:
  - Local implementation vs testbed implementation
  - Datasets
  - Algorithms
  - Single Sensor

### IOWA STATE UNIVERSITY

# **Project Plan – Milestones**

**College of Engineering** 

- Filter and track alerts through spatial and temporal data
- Accept continuous alerts from the sensor VMs
- Build a UI to display tracked anomaly data intuitively
- Process every alerts in 10 ms delay for real time operation
- Eliminate false positives with 90% accuracy

#### IOWA STATE UNIVERSITY

#### IOWA STATE UNIVERSITY

## Conclusion

We aim to use a machine learning algorithm within our VM to process alerts, ensuring that they contain all the necessary information such as time, location, severity, and type to be analyzed by a user. We will go into the future of this project with the ultimate goal of designing a user experience that emphasizes accuracy, speed, and utility.
